# TILINGS AND MOSAICS

Regular, semiregular, aperiodic and Islamic tilings, coloured with colour theory

A tiling covers the plane with shapes, without gaps or overlaps. The same tiling changes character with its colouring: by kind of tile, by orientation, by mirror image, or so that neighbouring tiles always differ. Every page below draws the tilings of one Wikipedia article with several colourings; the colours come from the colour schemes of the RYB wheel or from traditional tile palettes. All of it is computed: lattices of polygons, duals, Penrose deflation, the hat metatiles, a search for Wang tilings and Hankin's method for star patterns.

## Colour schemes

RYB schemes take hues at fixed steps of the 12-hue wheel from a base hue (here red); when a tiling needs more colours than a scheme has, tints and shades of the same hues are added. The named palettes copy traditional glazed tiles.

# Triangular tiling

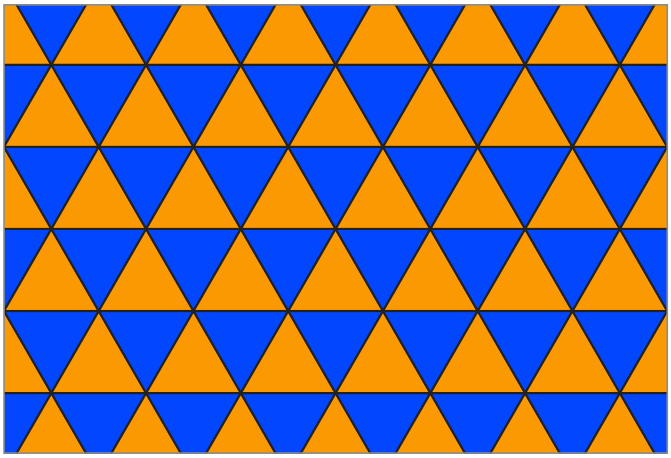

Wikipedia: Triangular tiling — en.wikipedia.org/wiki/Triangular_tiling

Six equilateral triangles meet at every vertex. Its uniform colourings are named by the colours around a vertex: 121212 alternates two colours, 121314 needs four. Cutting the triangles further gives the kisrhombille and kisdeltile tilings.

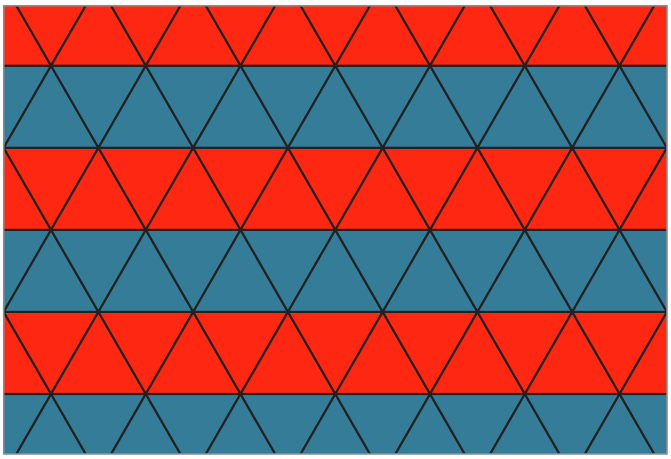

**Regular triangular tiling {3,6}**

Colouring: 111111 · monochromatic (blue)

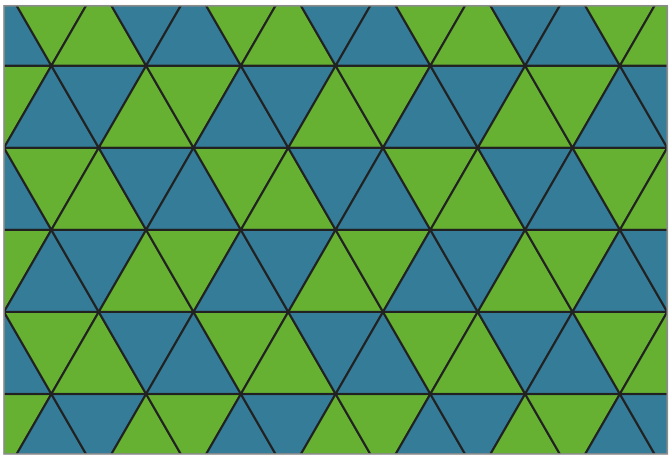

**Uniform colouring 121212**

Colouring: 121212 · complementary (orange)

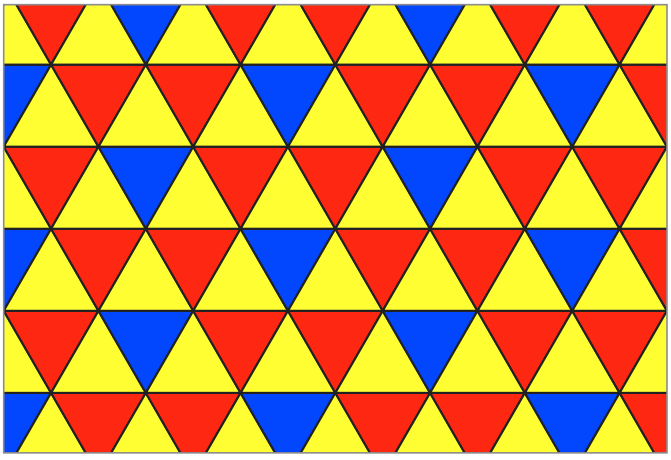

**Uniform colouring 111222**

Wikipedia: Triangular tiling — en.wikipedia.org/wiki/Triangular_tiling

Six equilateral triangles meet at every vertex. Its uniform colourings are named by the colours around a vertex: 121212 alternates two colours, 121314 needs four. Cutting the triangles further gives the kisrhombille and kisdeltile tilings.

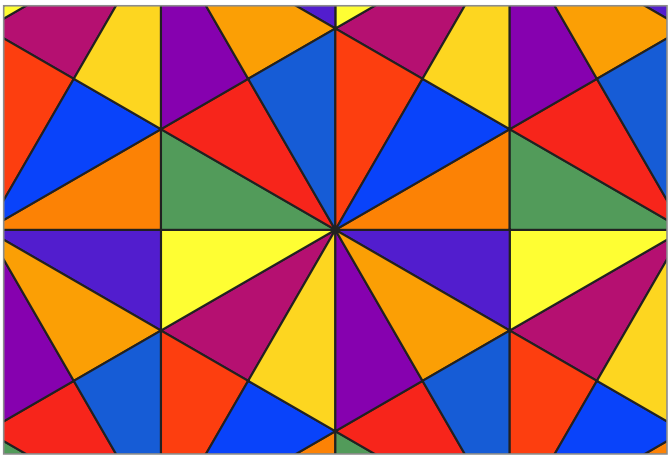

**Uniform colouring 111112**

Colouring: 111112 · tetrad (rectangle) (violet)

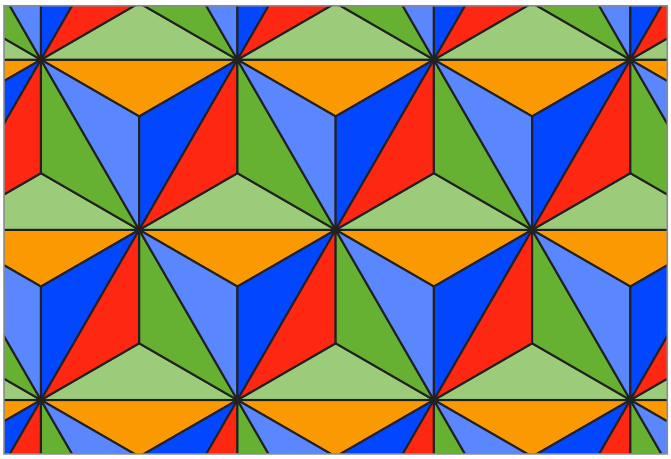

**Uniform colouring 121314**

Colouring: 121314 · square (red)

**Kisrhombille: 30-60-90 triangles (dual of 4.6.12)**

Colouring: by orientation · rainbow (yellow)

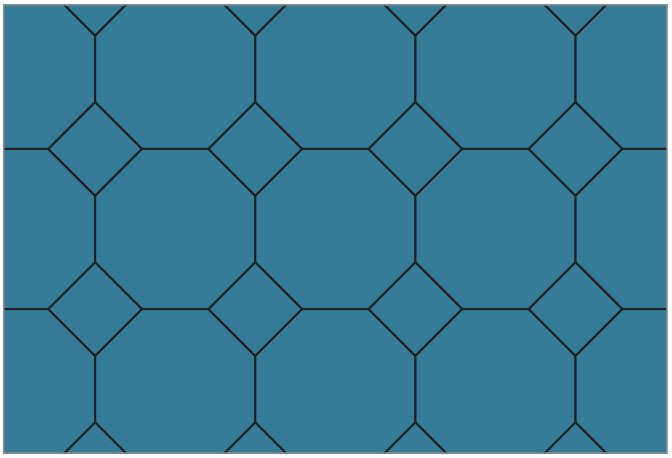

**Kisdeltile: 30-30-120 triangles (dual of 3.12.12)**

Colouring: by orientation · tetrad (rectangle) (blue)

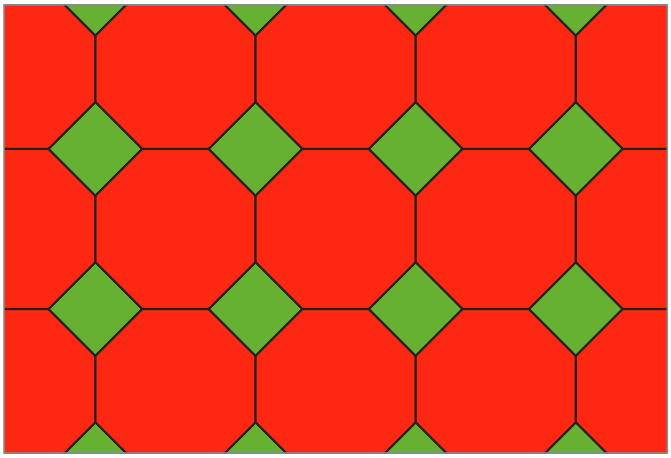

# Truncated square tiling

Wikipedia: Truncated square tiling — en.wikipedia.org/wiki/Truncated_square_tiling

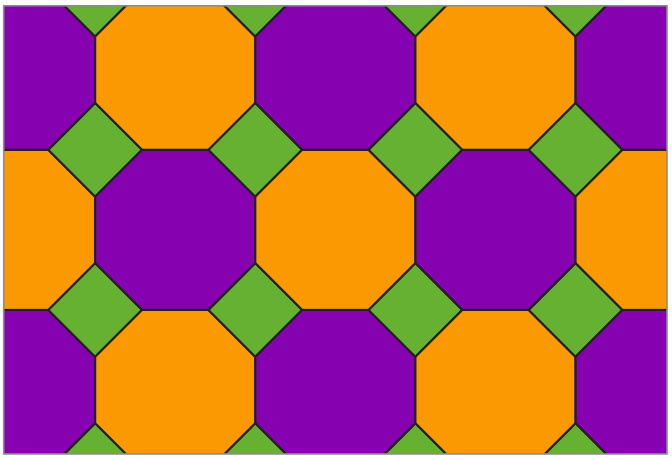

One square and two regular octagons at each vertex (4.8.8), the floor of many kitchens. The squares can take two sizes, and in the limit half of them vanish (chamfered tiling). Its dual is the tetrakis square tiling.

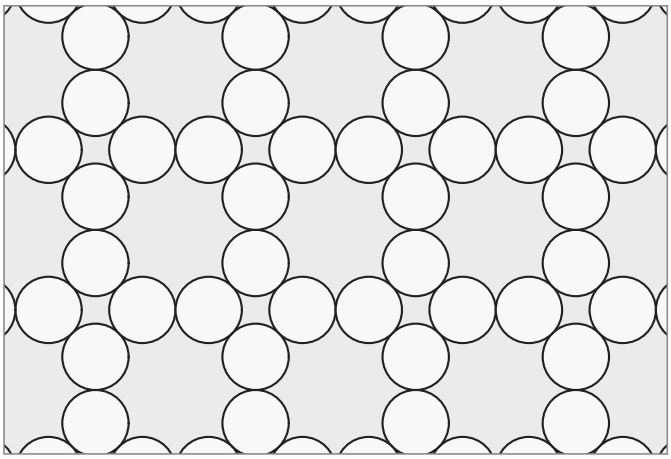

**Truncated square tiling 4.8.8**
Colouring: one colour · monochromatic (blue-green)

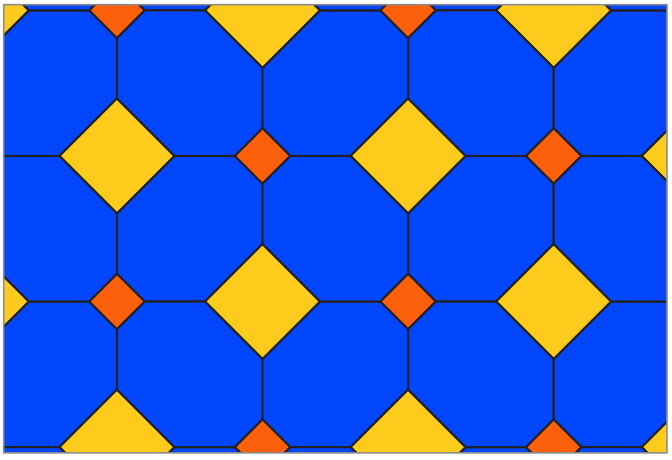

**Uniform colouring 122**
Colouring: 122 · complementary (red)

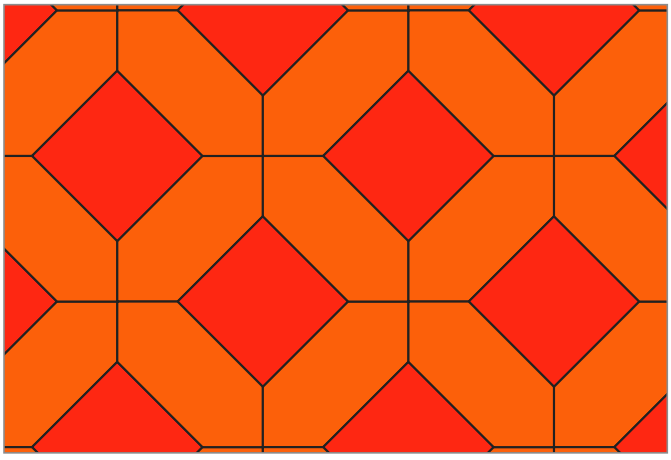

**Uniform colouring 123**
Colouring: 123 · triad (orange)

**Circle packing: a circle at every vertex**
Colouring: one colour · greys

**Squares of alternating sizes**
Colouring: by kind of tile · split complementary (blue)

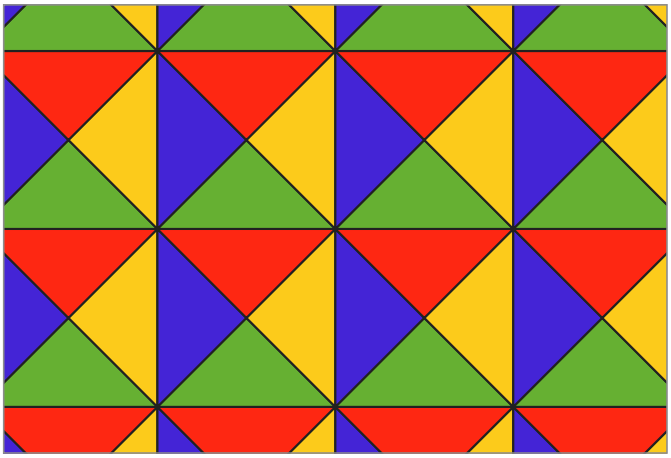

**Chamfered square tiling (small squares vanish)**
Colouring: by kind of tile · analogous (red-orange)

# Truncated square tiling  (continued)

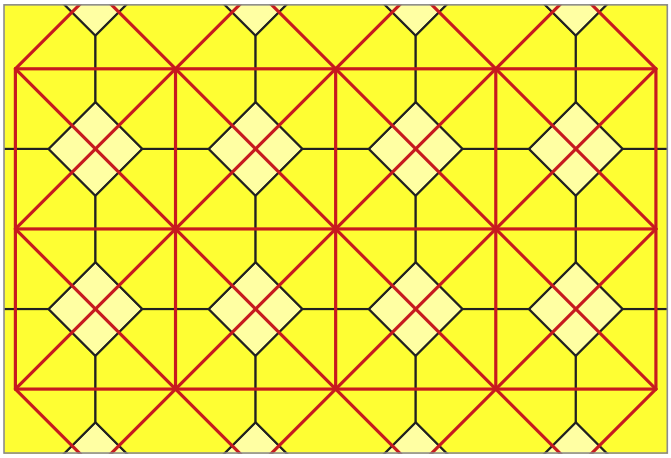

Wikipedia: Truncated square tiling — en.wikipedia.org/wiki/Truncated_square_tiling

One square and two regular octagons at each vertex (4.8.8), the floor of many kitchens. The squares can take two sizes, and in the limit half of them vanish (chamfered tiling). Its dual is the tetrakis square tiling.

**Tetrakis square tiling (dual of 4.8.8)**

Colouring: by orientation · square (yellow-orange)

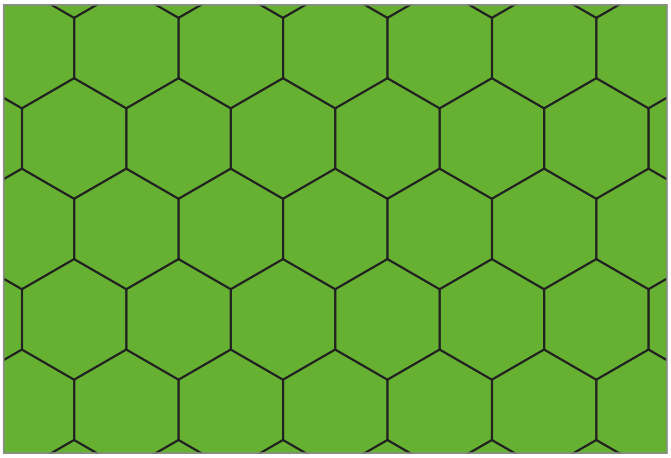

**With its dual drawn over it**

Colouring: 122 · monochromatic (yellow)

# Hexagonal tiling

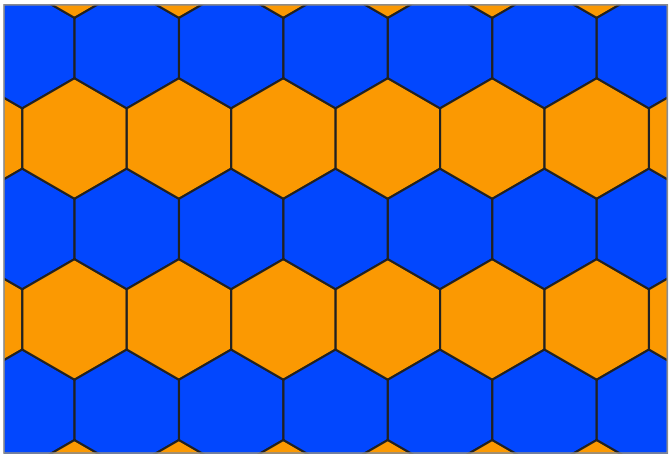

Wikipedia: Hexagonal tiling — en.wikipedia.org/wiki/Hexagonal_tiling

Three hexagons at each vertex, as in a honeycomb. Hexagons can be coloured with 2, 3, 4 or 7 colours in a regular way; with 7 every hexagon touches all the other colours. Cutting some hexagons into triangles gives 2-uniform tilings.

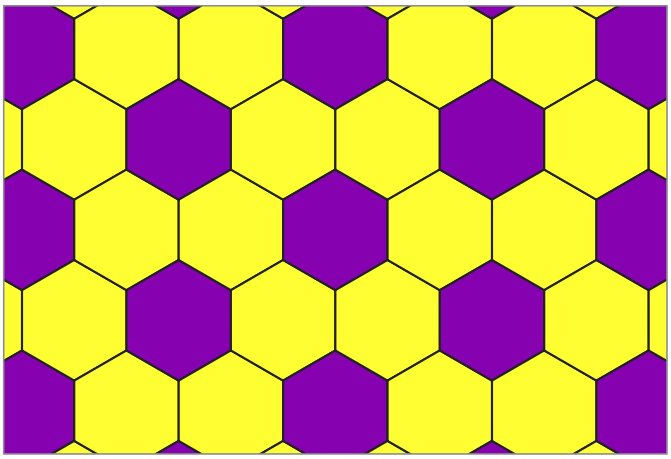

**Regular hexagonal tiling {6,3}**

Colouring: 1 · monochromatic (green)

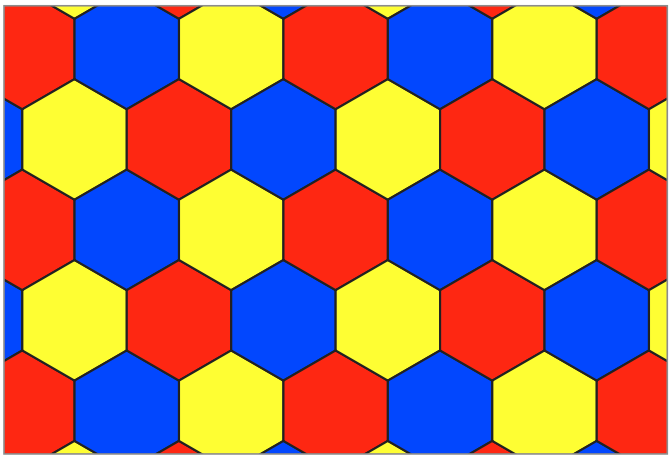

**Two colours, in rows**

Colouring: 2 · complementary (blue)

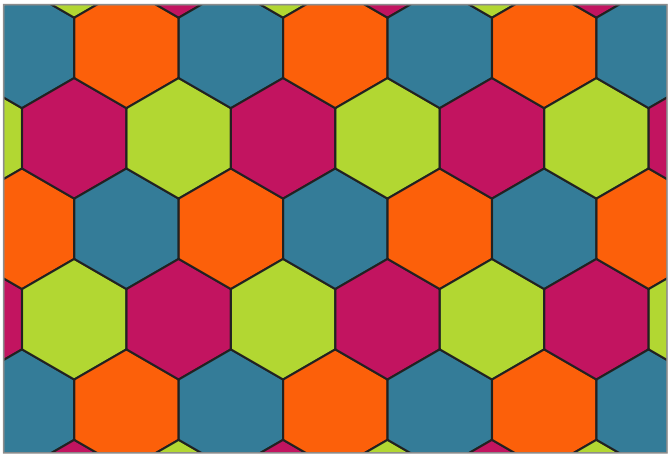

**Two colours, one hexagon in three**

Colouring: 2-1 · complementary (yellow)

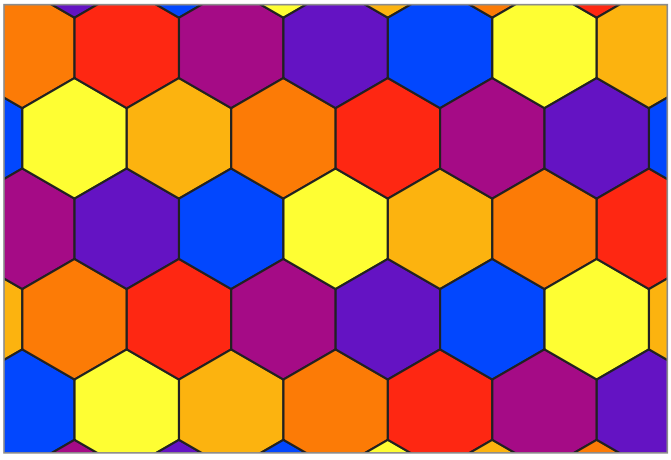

**Three colours: neighbours always differ**

Colouring: 3 · triad (red)

**Four colours**

Colouring: 4 · tetrad (rectangle) (blue-green)

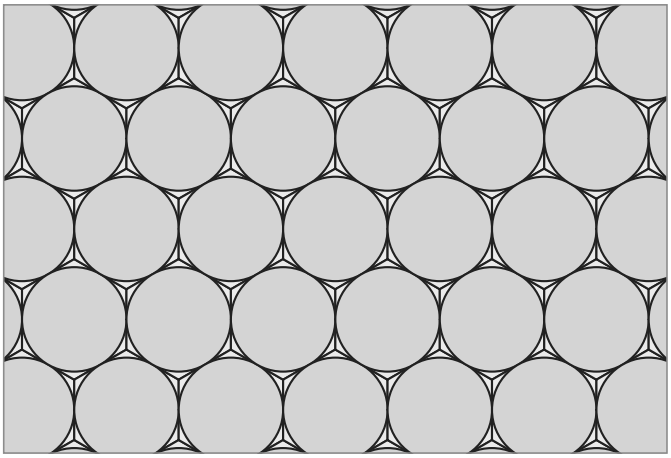

**Seven colours: each hexagon touches all the others**

Colouring: 7 · rainbow (yellow)

# Hexagonal tiling  (continued)

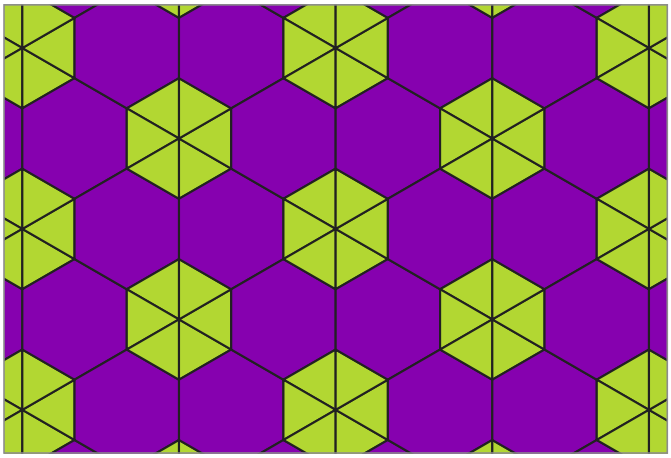

Wikipedia: Hexagonal tiling — en.wikipedia.org/wiki/Hexagonal_tiling

Three hexagons at each vertex, as in a honeycomb. Hexagons can be coloured with 2, 3, 4 or 7 colours in a regular way; with 7 every hexagon touches all the other colours. Cutting some hexagons into triangles gives 2-uniform tilings.

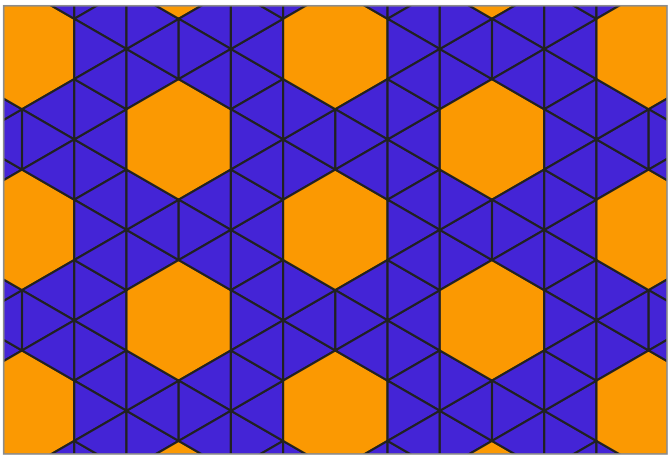

**Densest packing of circles**

Colouring: 1 · greys

**2-uniform: a third of the hexagons cut into triangles**

Colouring: by kind of tile · split complementary (violet)

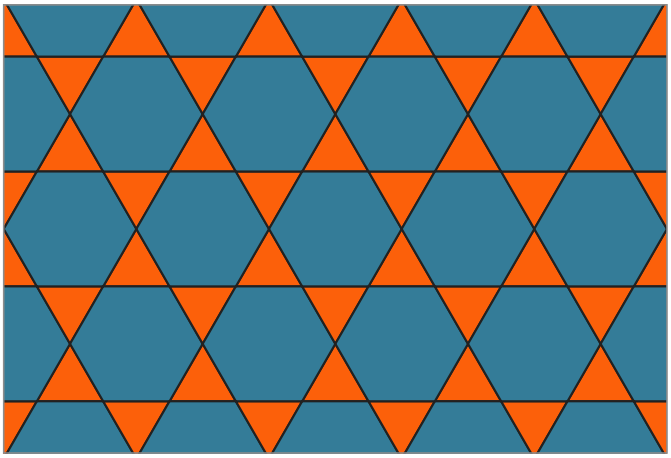

**2-uniform: two thirds of the hexagons cut into triangles**

Colouring: by kind of tile · split complementary (orange)

# Trihexagonal tiling

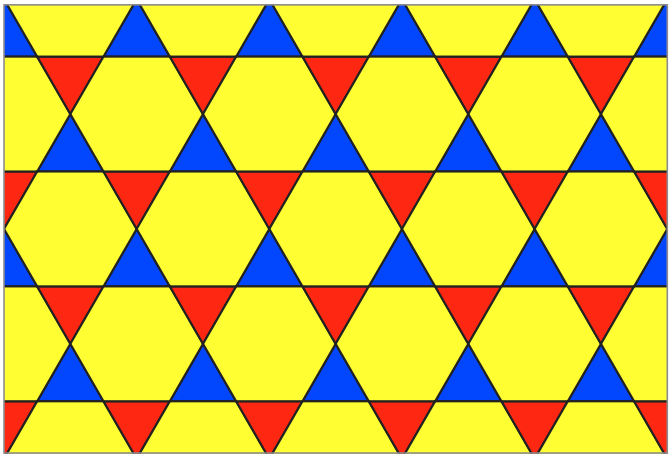

Wikipedia: Trihexagonal tiling — en.wikipedia.org/wiki/Trihexagonal_tiling

Triangles and hexagons alternate around each vertex (3.6.3.6); its edges are three families of straight lines, the kagome pattern of Japanese baskets. Turning or resizing the triangles keeps the same structure.

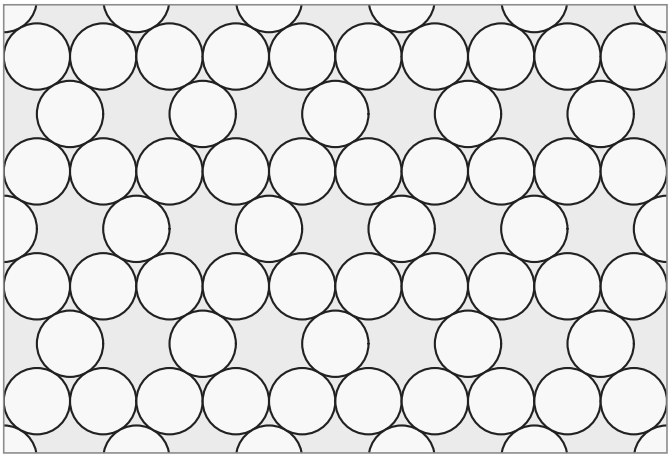

**Uniform colouring 1212**

Colouring: 1212 · complementary (blue-green)

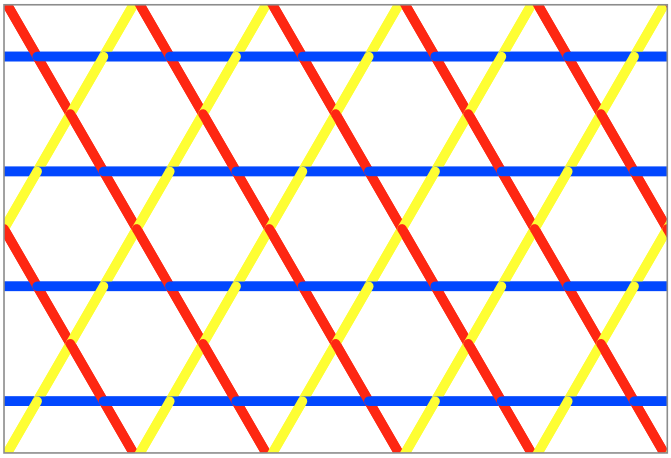

**Uniform colouring 1232**

Colouring: 1232 · triad (yellow)

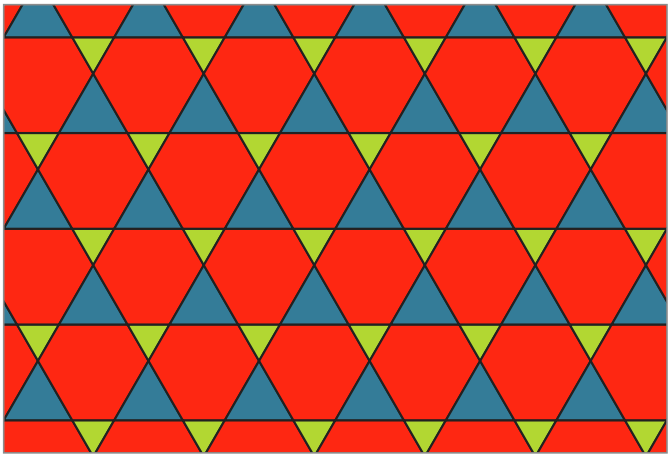

**Circle packing: a circle at every vertex**

Colouring: one colour · greys

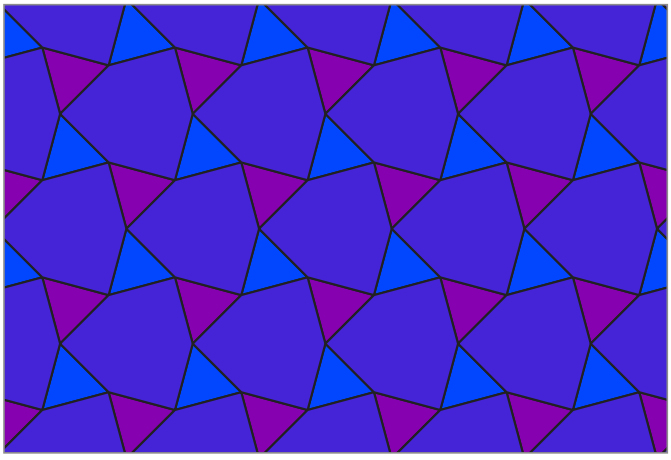

**Kagome: edges coloured by direction**

Colouring: one colour · triad (blue)

**Triangles of two sizes**

Colouring: by kind of tile · split complementary (red)

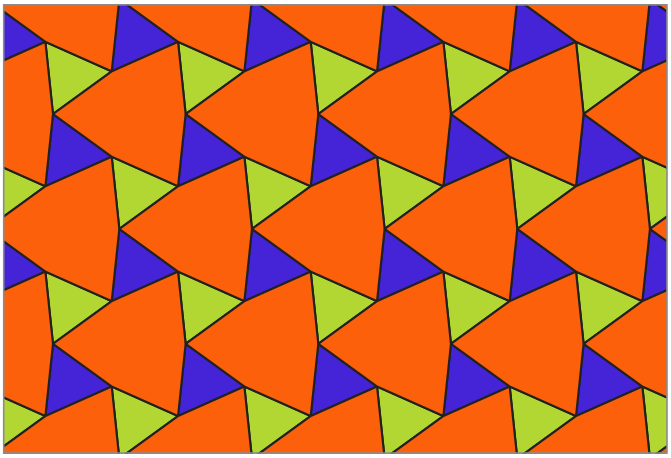

**Turned triangles: the hexagons become stars**

Colouring: by kind of tile · analogous (blue-violet)

# Trihexagonal tiling  (continued)

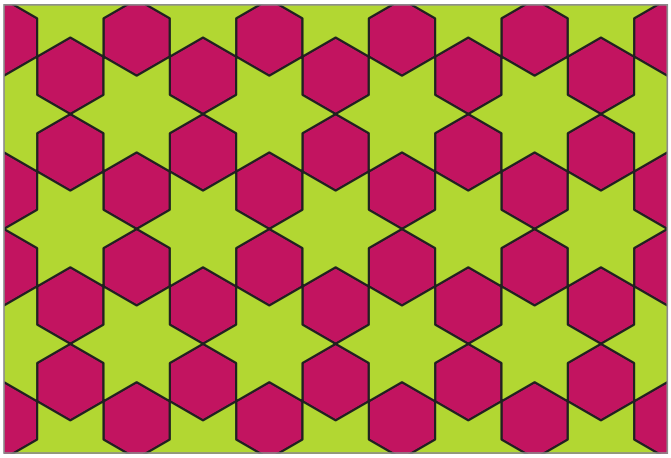

Wikipedia: Trihexagonal tiling — en.wikipedia.org/wiki/Trihexagonal_tiling

Triangles and hexagons alternate around each vertex (3.6.3.6); its edges are three families of straight lines, the kagome pattern of Japanese baskets. Turning or resizing the triangles keeps the same structure.

**Turned further**

Colouring: by kind of tile · triad (red-orange)

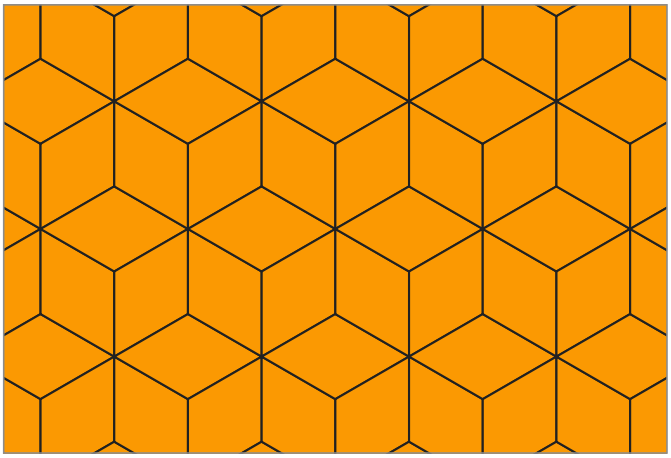

**Hexagons and six-pointed stars**

Colouring: by kind of tile · complementary (red-violet)

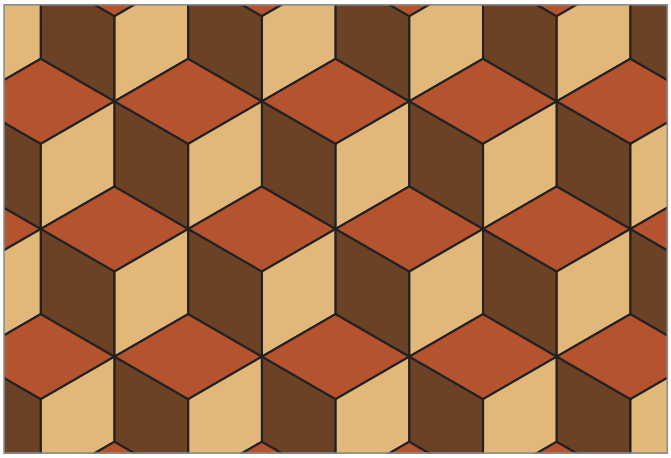

# Rhombille tiling

Wikipedia: Rhombille tiling — en.wikipedia.org/wiki/Rhombille_tiling

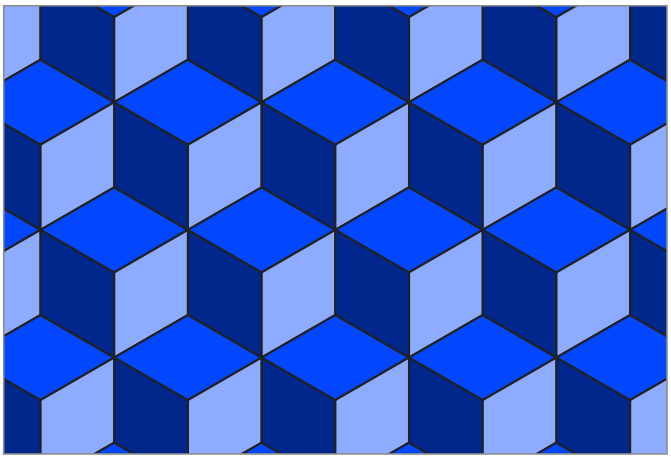

Identical 60° rhombi, three around one corner and six around the other: the dual of the trihexagonal tiling. With three values of one hue it reads as a stack of cubes, a pattern found on old floors such as Siena Cathedral.

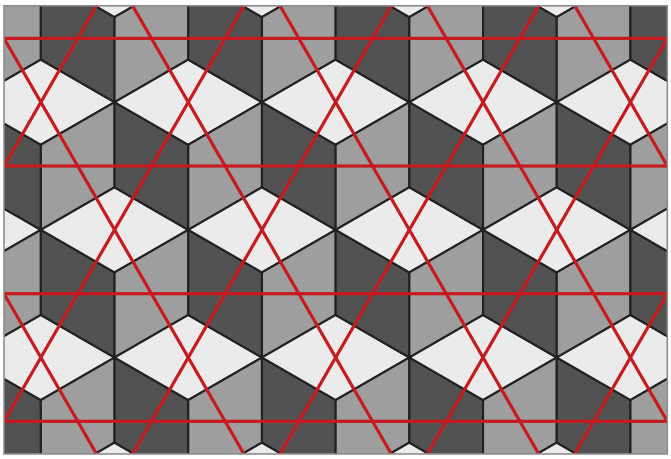

**Rhombille tiling: 60° rhombi**
Colouring: one colour · monochromatic (orange)

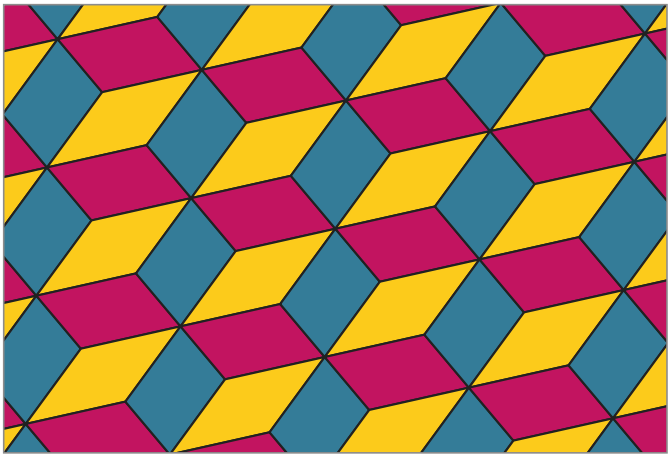

**Three shades by orientation, as in Siena Cathedral**
Colouring: by orientation · earth tones

**Stacked cubes: one hue in three values**
Colouring: by orientation · monochromatic (blue)

**Over its dual, the trihexagonal tiling**
Colouring: by orientation · greys

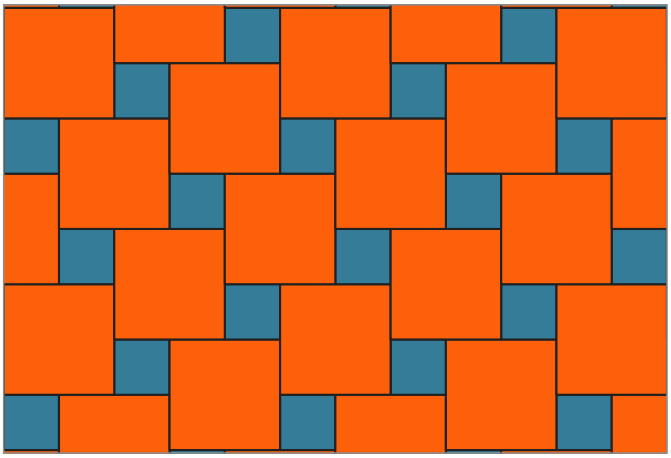

**Skewed and turned: parallelograms**
Colouring: by orientation · triad (yellow-orange)

# Pythagorean tiling

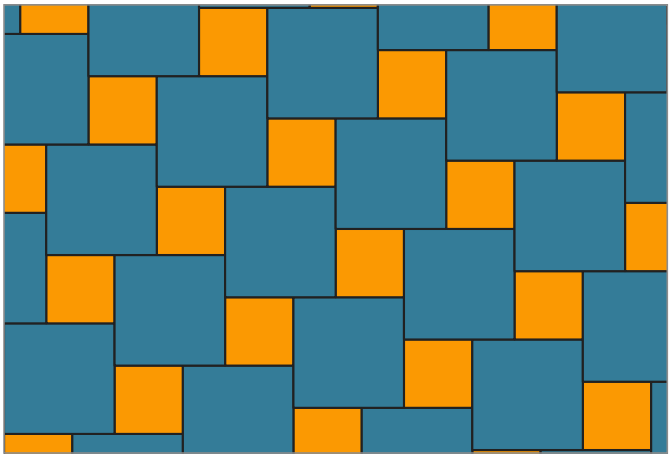

Wikipedia: Pythagorean tiling — en.wikipedia.org/wiki/Pythagorean_tiling

Squares of two sizes, each touching four squares of the other size. It is the picture behind a classic proof of Pythagoras' theorem, and a common floor pattern (pinwheel or hopscotch).

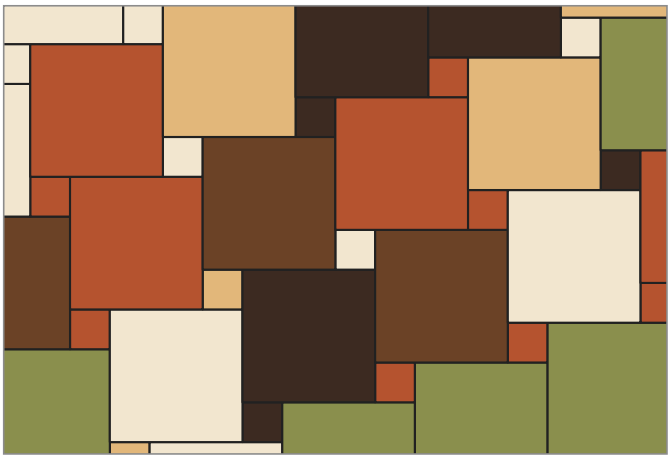

**Squares of sides 1 and 1/2**

Colouring: by kind of tile · complementary (red-orange)

**Sides in the golden ratio**

Colouring: by kind of tile · split complementary (blue-green)

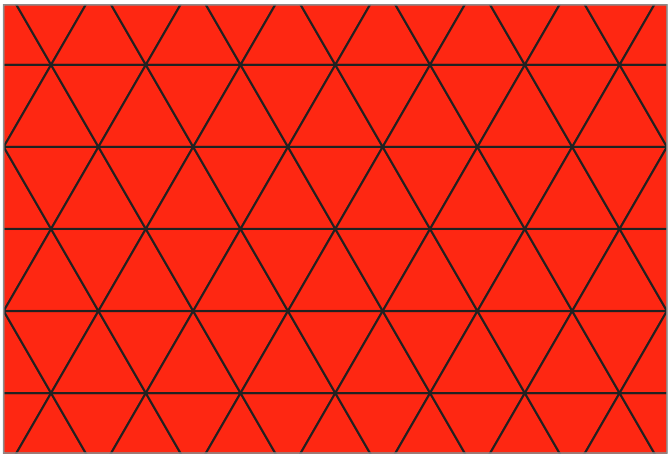

**Sides 1 and 0.3, random earth tones**

Colouring: random · earth tones

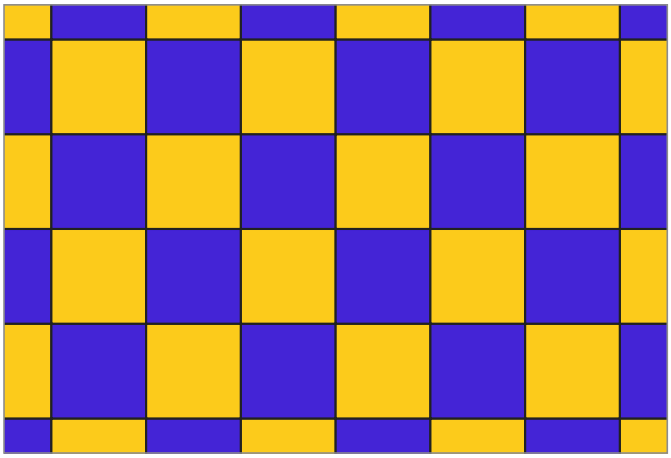

# Regular polygons

Wikipedia: Euclidean tilings by convex regular polygons — en.wikipedia.org/wiki/Euclidean_tilings_by_convex_regular_polygons

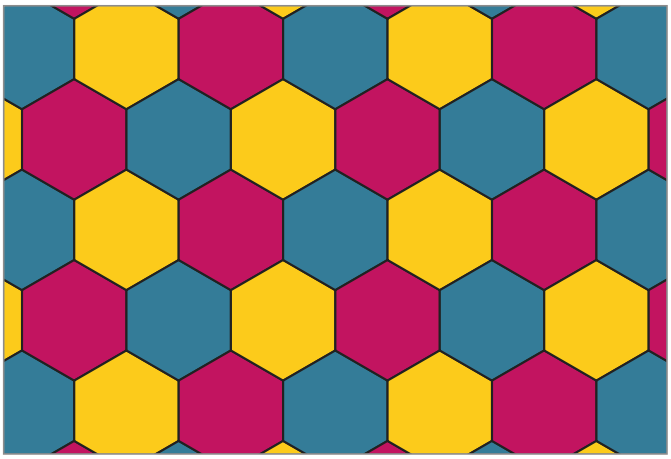

The eleven uniform (Archimedean) tilings by regular polygons: every vertex has the same polygons around it, written as their numbers of sides (3.4.6.4 is triangle, square, hexagon, square). Mixing vertex types gives k-uniform tilings.

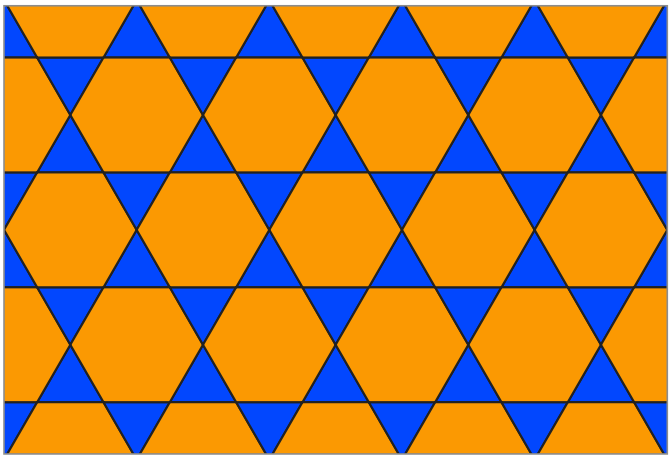

**3.3.3.3.3.3 triangular**
Colouring: 111111 · monochromatic (red)

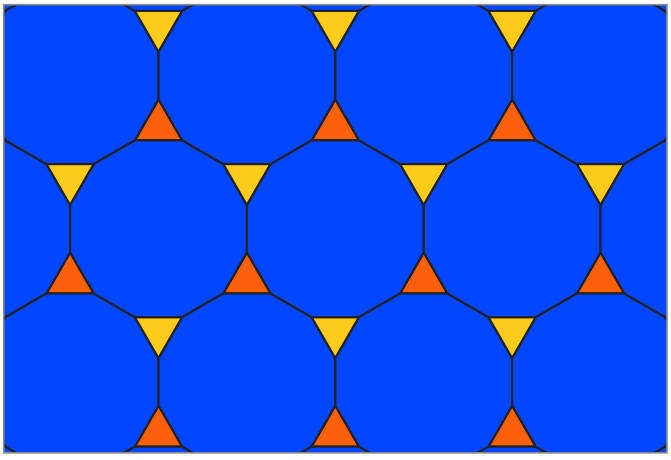

**4.4.4.4 square**
Colouring: checkerboard · complementary (yellow-orange)

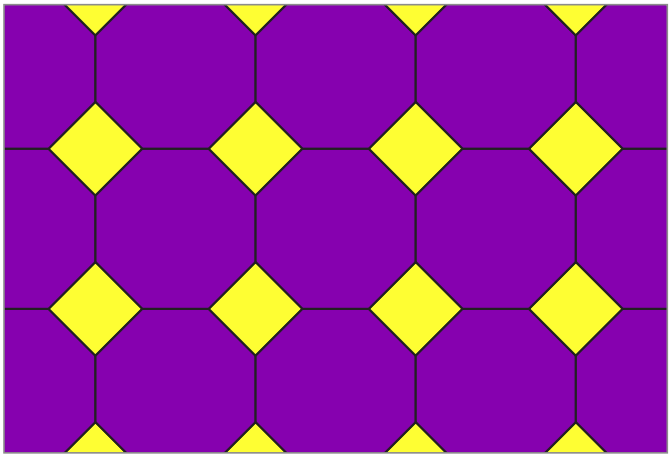

**6.6.6 hexagonal**
Colouring: 3 · triad (blue-green)

**3.6.3.6 trihexagonal**
Colouring: 1212 · complementary (orange)

**3.12.12 truncated hexagonal**
Colouring: by kind of tile · split complementary (blue)

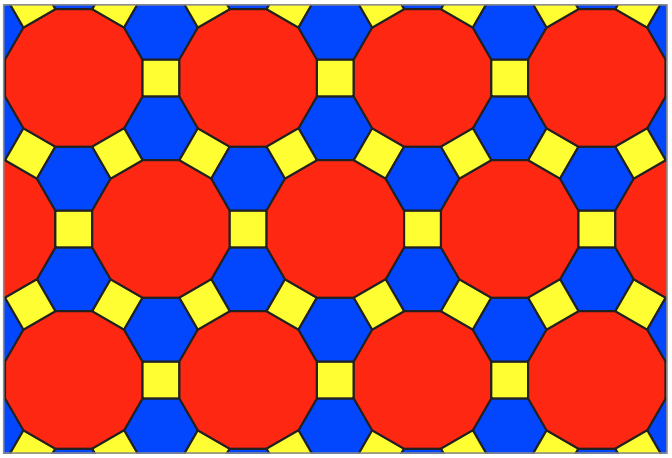

**4.8.8 truncated square**
Colouring: by kind of tile · complementary (violet)

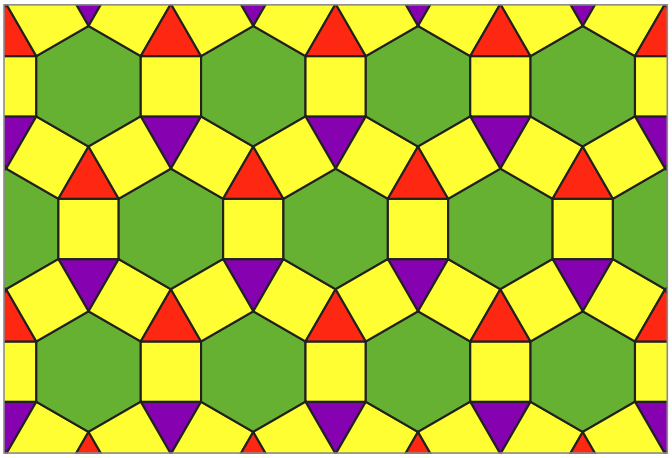

# Regular polygons  (continued)

Wikipedia: Euclidean tilings by convex regular polygons — en.wikipedia.org/wiki/Euclidean_tilings_by_convex_regular_polygons

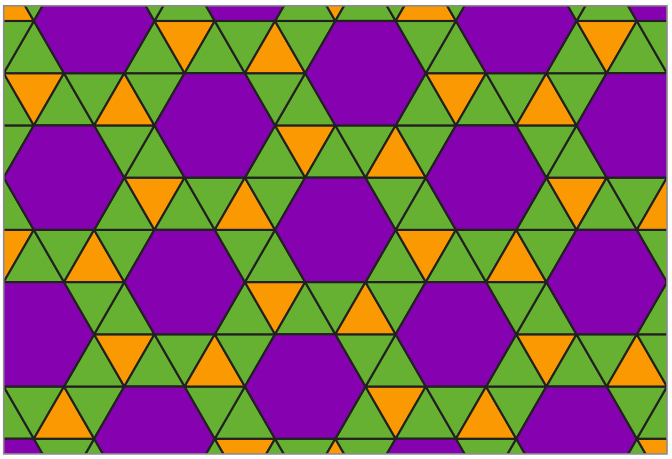

The eleven uniform (Archimedean) tilings by regular polygons: every vertex has the same polygons around it, written as their numbers of sides (3.4.6.4 is triangle, square, hexagon, square). Mixing vertex types gives k-uniform tilings.

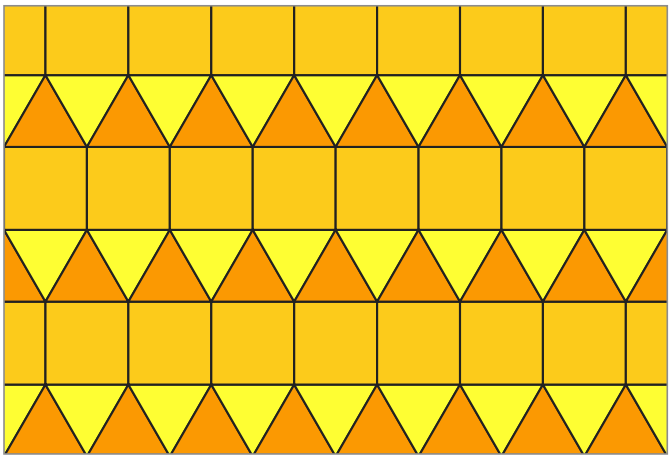

**4.6.12 truncated trihexagonal**
Colouring: by kind of tile · triad (red)

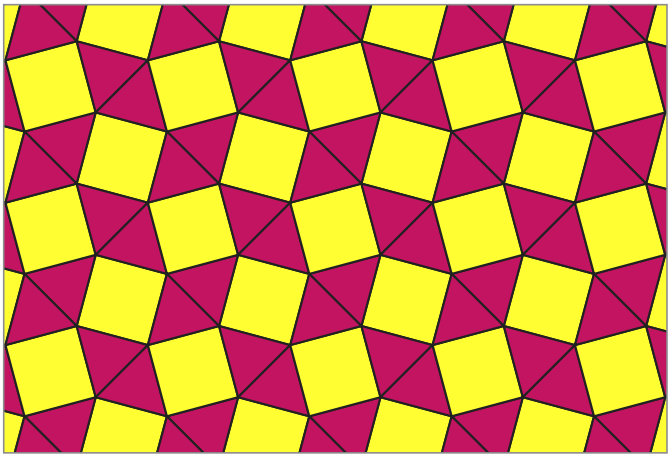

**3.4.6.4 rhombitrihexagonal**
Colouring: by kind of tile · tetrad (rectangle) (green)

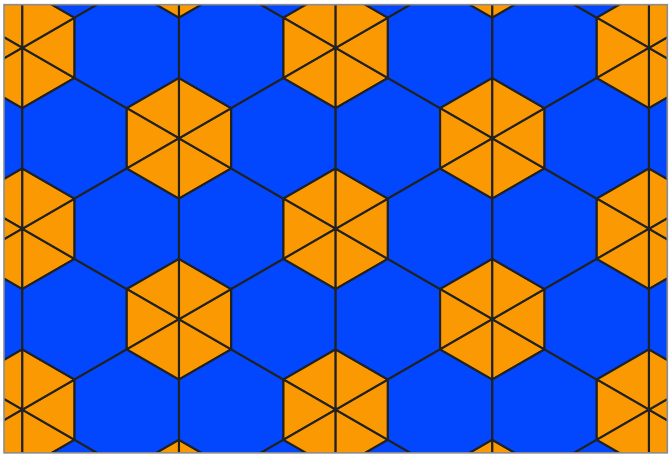

**3.3.3.3.6 snub hexagonal**
Colouring: by kind of tile · triad (violet)

**3.3.3.4.4 elongated triangular**
Colouring: by kind of tile · analogous (yellow-orange)

**3.3.4.3.4 snub square**
Colouring: by kind of tile · split complementary (yellow)

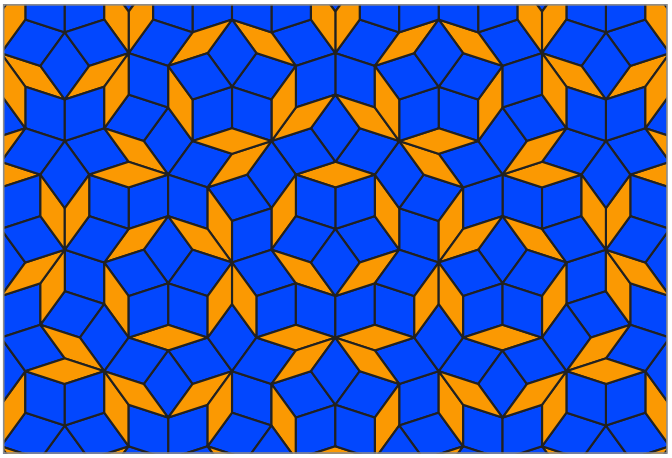

**2-uniform: a third of the hexagons cut into triangles**
Colouring: by kind of tile · complementary (blue)

# Penrose tilings

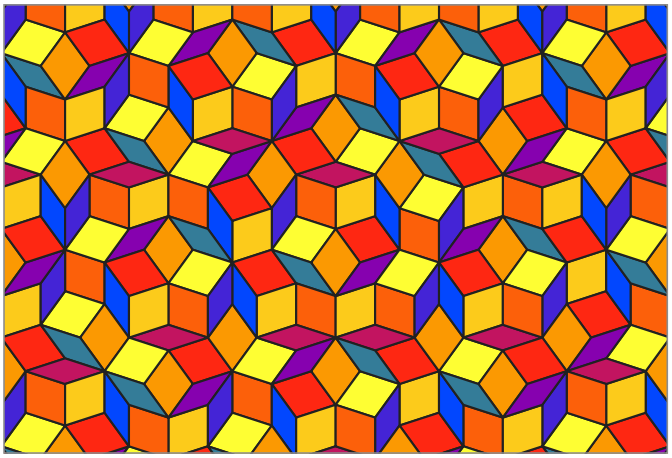

Wikipedia: Penrose tiling — en.wikipedia.org/wiki/Penrose_tiling

Two tiles that cover the plane only without repeating: thick and thin rhombs (P3), or kites and darts (P2). They are drawn by repeatedly cutting golden triangles (deflation) and show five-fold symmetry everywhere.

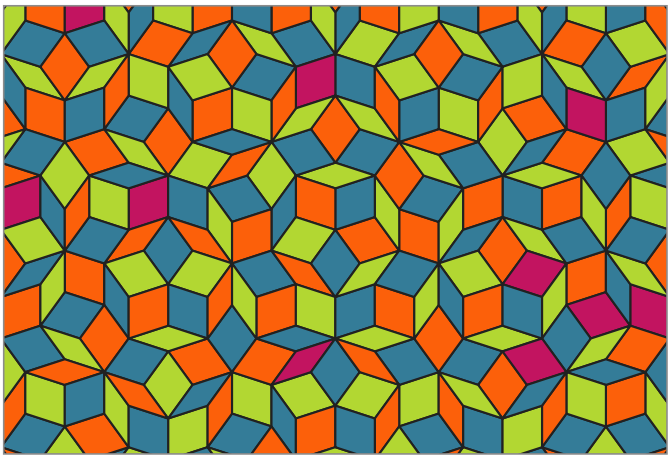

**P3: thick and thin rhombs**

Colouring: by kind of tile · complementary (blue)

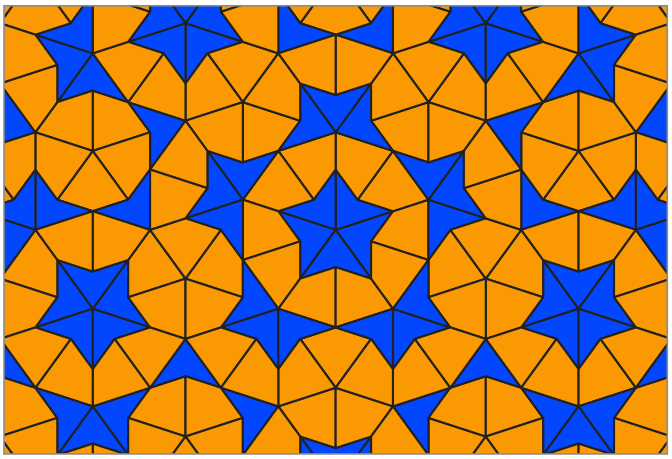

**P3 by the ten orientations of the rhombs**

Colouring: by orientation · rainbow (yellow)

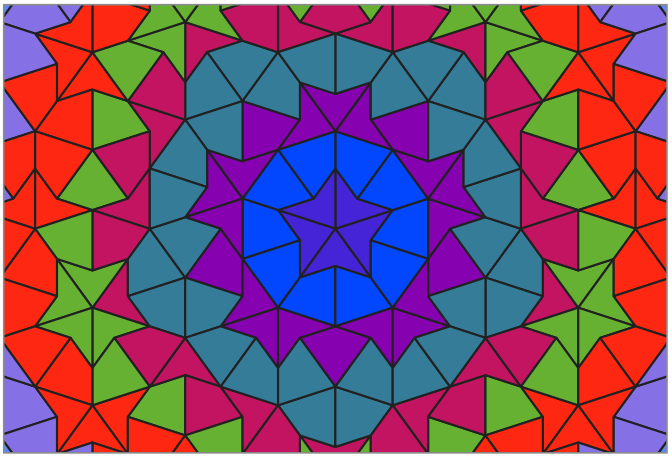

**P3, neighbouring rhombs differ**

Colouring: neighbours differ · tetrad (rectangle) (blue-green)

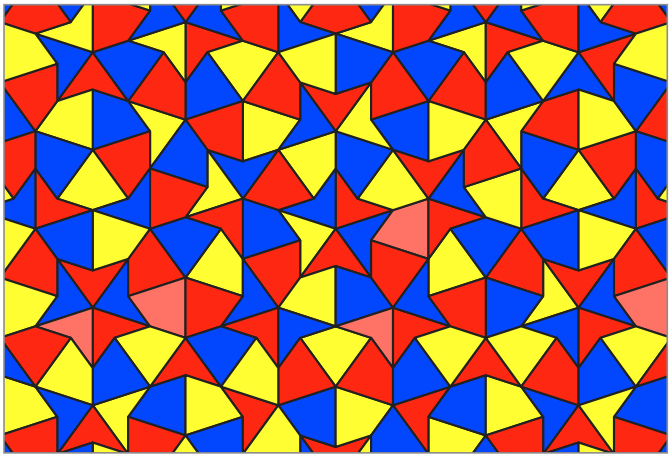

**P2: kites and darts**

Colouring: by kind of tile · complementary (orange)

**P2 in rings round the centre**

Colouring: rings from the centre · analogous (blue-violet)

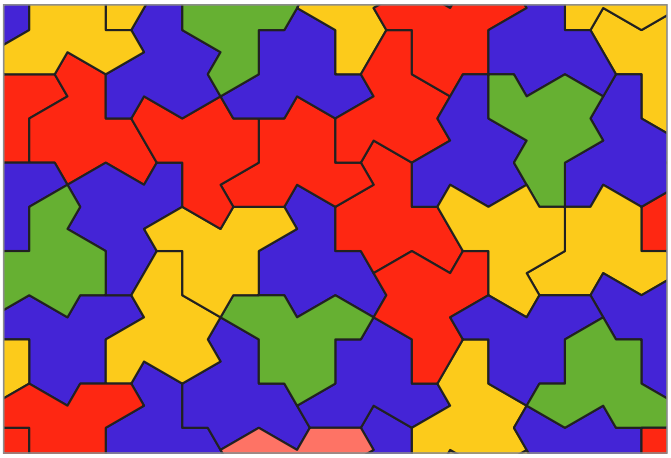

**P2, neighbouring tiles differ**

Colouring: neighbours differ · triad (red)

# Aperiodic tilings

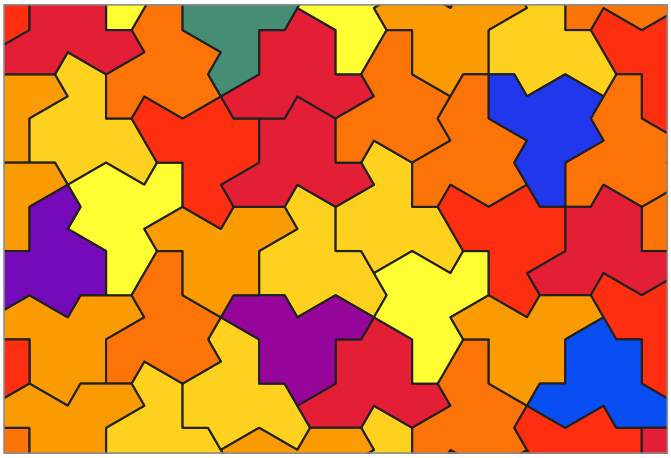

Wikipedia: Aperiodic tiling — en.wikipedia.org/wiki/Aperiodic_tiling

Tilings that never repeat. The hat (2023) is a single shape, used with its mirror image, that tiles only aperiodically; Robinson's six square tiles force nested squares of ever larger sizes.

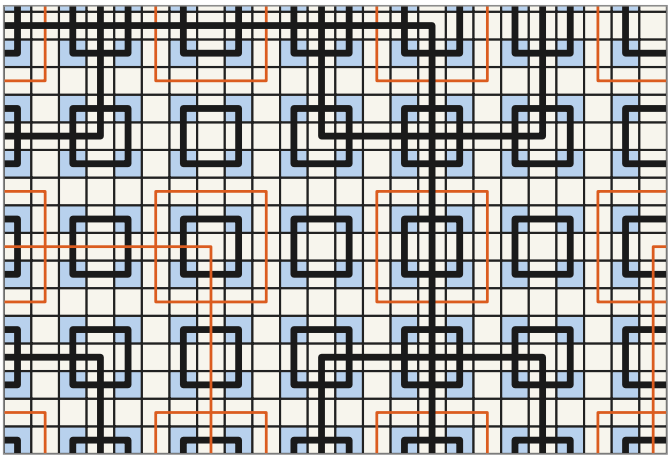

**The hat: one shape and its mirror image**

Colouring: by kind of tile · square (red)

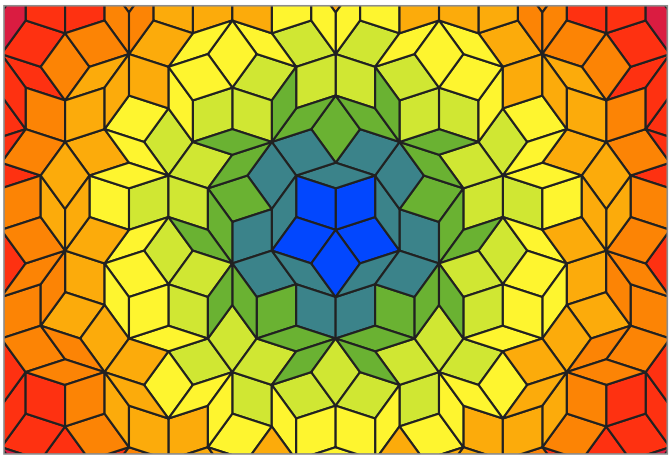

**Hats by orientation**

Colouring: by orientation · rainbow (yellow)

**Robinson tiles: their marks draw nested squares**

Colouring: by kind of tile

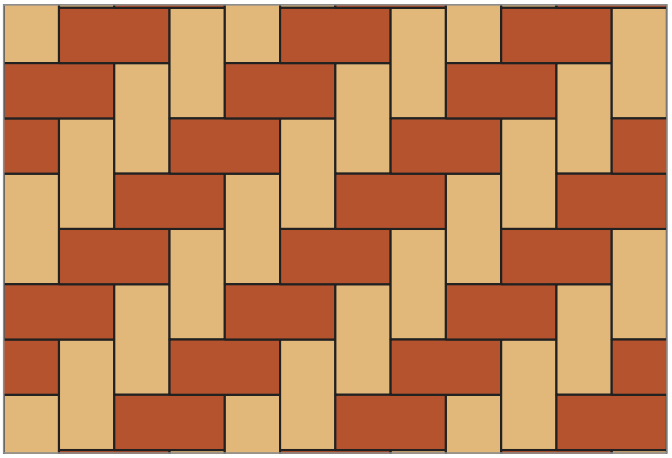

**P3 in rings round the centre**

Colouring: rings from the centre · rainbow (blue)

# Herringbone pattern

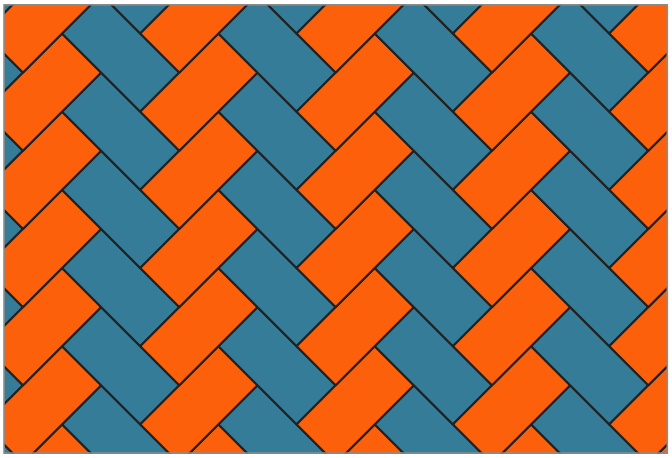

Wikipedia: Herringbone pattern — en.wikipedia.org/wiki/Herringbone_pattern

Rectangles laid in a staircase, each at right angles to its neighbours: the classic brick and parquet pattern. Longer bricks, a 45° turn or parallelograms change its look; the basket weave pairs the bricks instead.

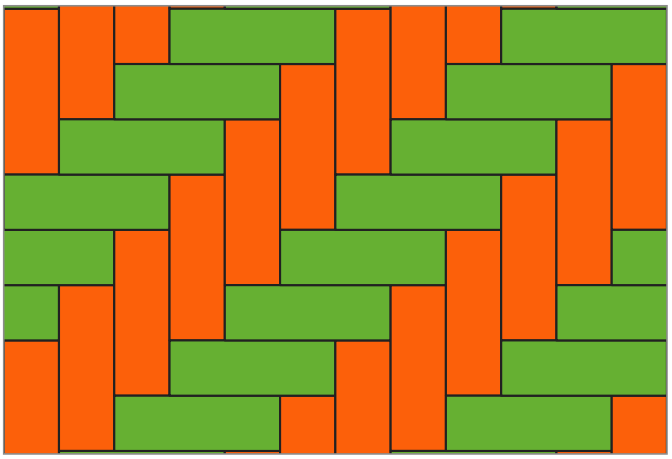

**Bricks 2:1**

Colouring: by kind of tile · earth tones

**Turned 45°**

Colouring: by kind of tile · complementary (red-orange)

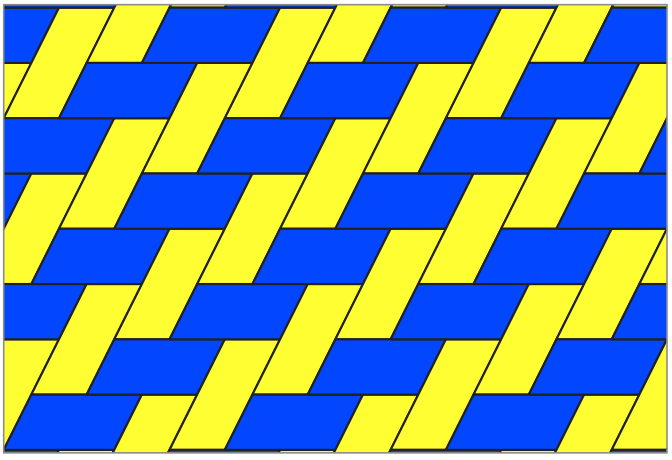

**Bricks 3:1**

Colouring: by kind of tile · split complementary (green)

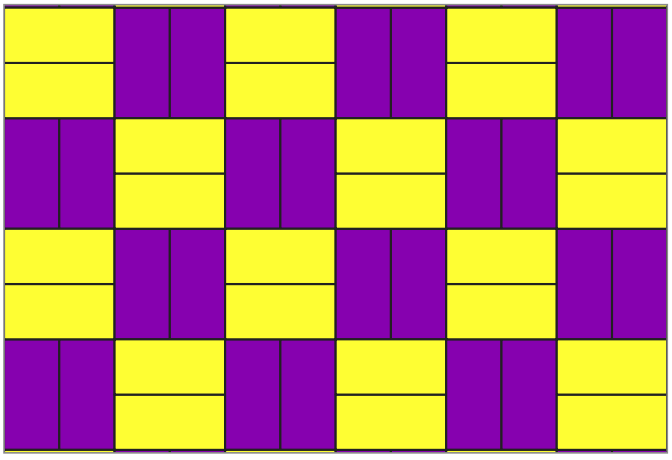

**Long boards, about 6.6:1**

Colouring: random · earth tones

**Parallelograms**

Colouring: by kind of tile · triad (blue)

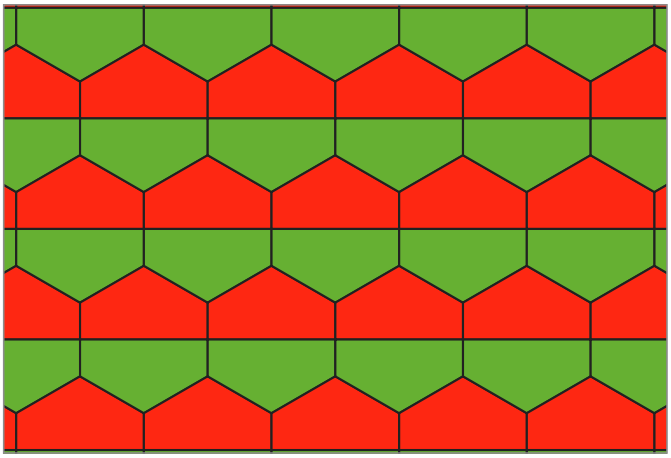

**Basket weave**

Colouring: by kind of tile · complementary (yellow)

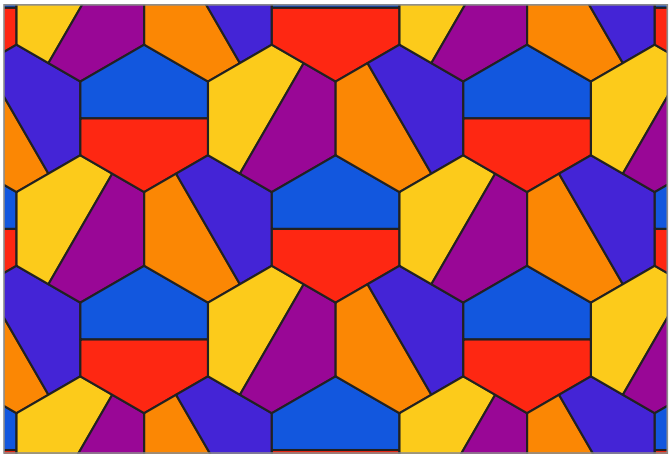

# Pentagonal tilings

Wikipedia: Pentagonal tiling — en.wikipedia.org/wiki/Pentagonal_tiling

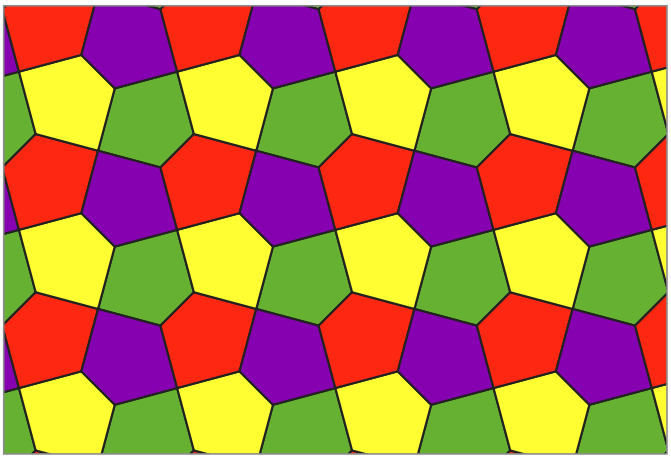

Regular pentagons cannot tile the plane, but 15 families of convex pentagons can. Halving hexagons gives type 1; the duals of three uniform tilings give the Cairo, prismatic and floret pentagonal tilings.

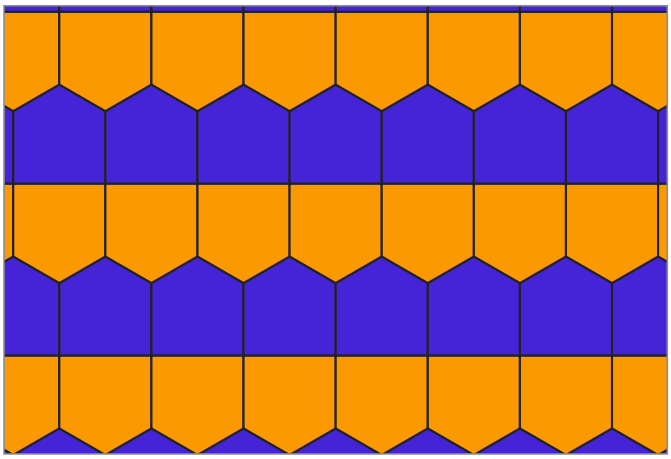

**Type 1: hexagons cut in half**
Colouring: by kind of tile · complementary (green)

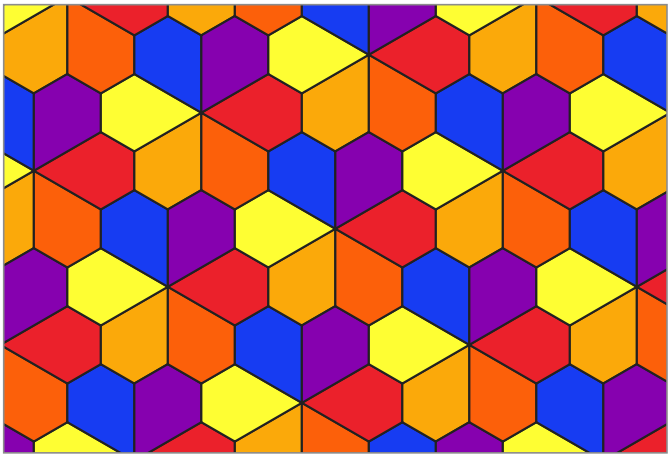

**Type 1, cut in three directions**
Colouring: by orientation · rainbow (yellow-orange)

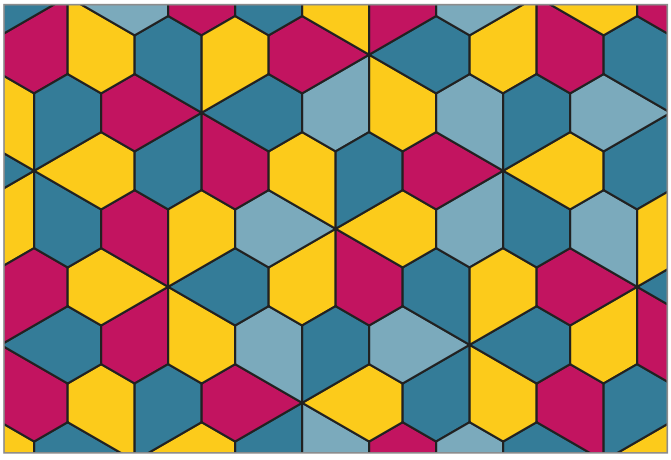

**Cairo tiling (types 2 and 4)**
Colouring: by orientation · tetrad (rectangle) (red)

**Prismatic pentagonal (dual of 3.3.3.4.4)**
Colouring: by orientation · split complementary (orange)

**Floret pentagonal (dual of 3.3.3.3.6)**
Colouring: by orientation · rainbow (yellow)

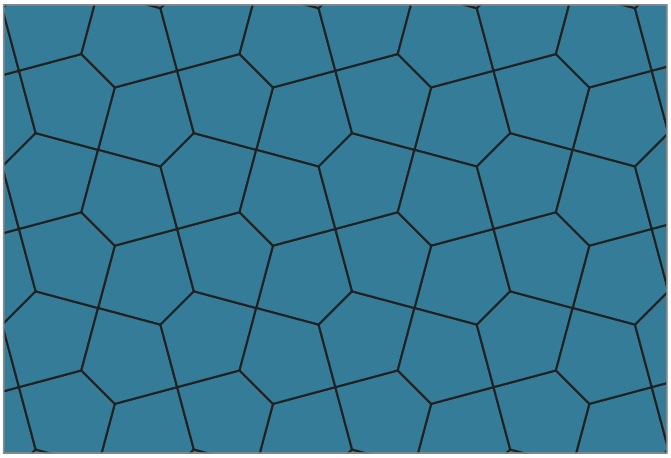

**Floret pentagonal, neighbours differ**
Colouring: neighbours differ · triad (blue-green)

# Cairo pentagonal tiling

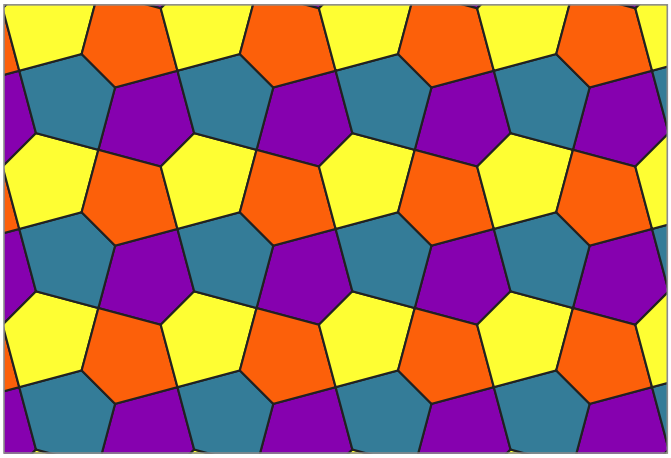

Wikipedia: Cairo pentagonal tiling — en.wikipedia.org/wiki/Cairo_pentagonal_tiling

Pentagons with four long sides and one short side, the dual of the snub square tiling, named after the streets of Cairo. Four pentagons meet at some vertices, three at others, and pairs of pentagons form hexagons.

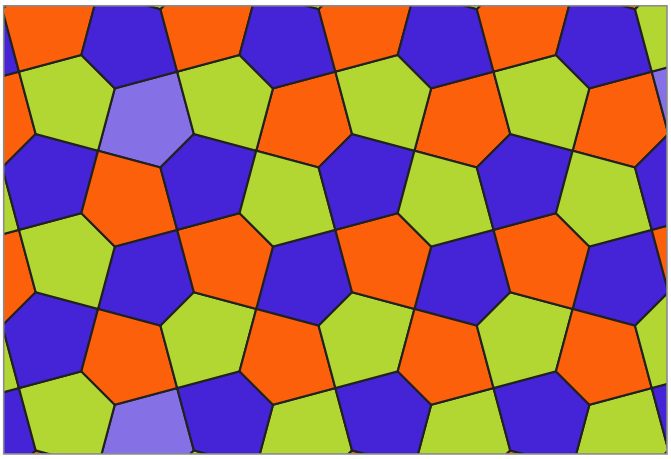

**Cairo tiling: dual of the snub square tiling**

Colouring: one colour · monochromatic (blue-green)

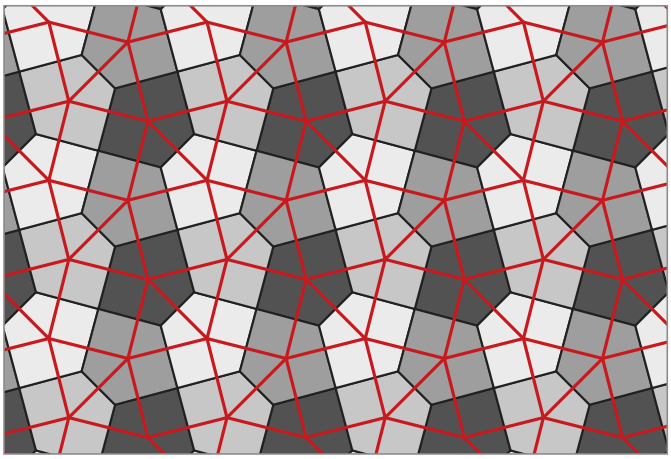

**Four orientations**

Colouring: by orientation · square (yellow)

**Neighbouring pentagons differ**

Colouring: neighbours differ · triad (blue-violet)

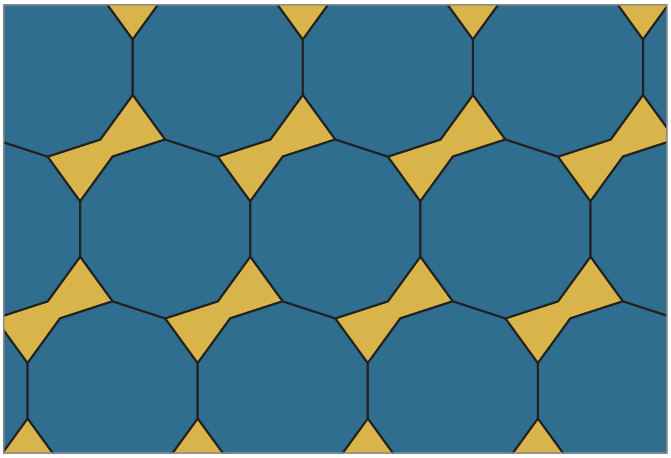

**Over its dual, the snub square tiling**

Colouring: by orientation · greys

# Girih tiles

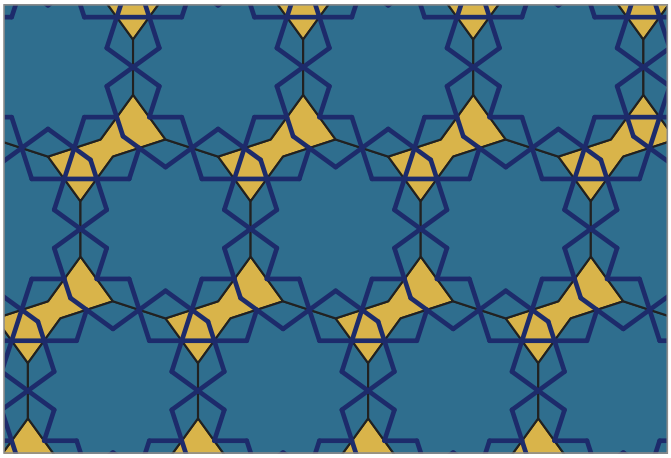

Wikipedia: Girih tile — en.wikipedia.org/wiki/Girih_tile

Five equal-sided tiles (decagon, pentagon, hexagon, bowtie, rhombus) used in Persian architecture. Lines drawn on them cross every edge at its midpoint at 54°, so they join across tiles into the visible star pattern.

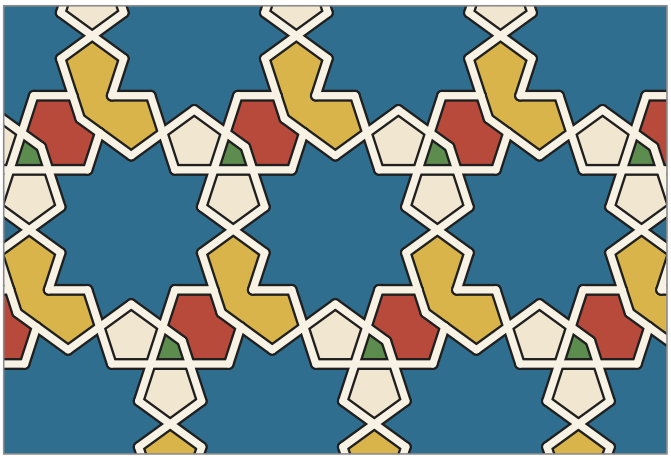

**Decagons and bowties**

Colouring: by kind of tile · girih palette

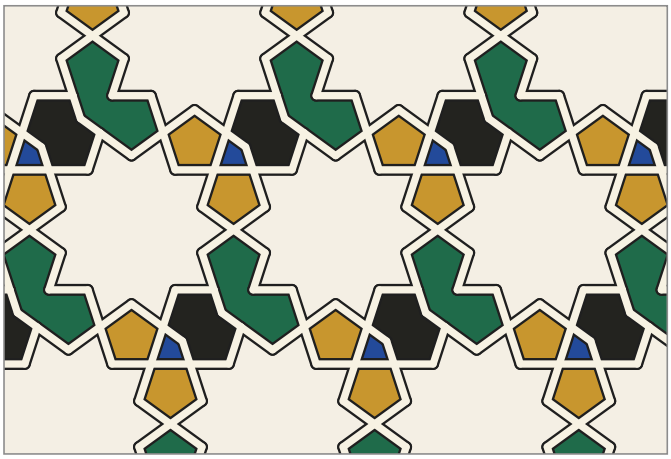

**Girih lines, crossing every edge at 54°**

Colouring: by kind of tile · girih palette

**The girih pattern, coloured**

Colouring: by shape · girih palette

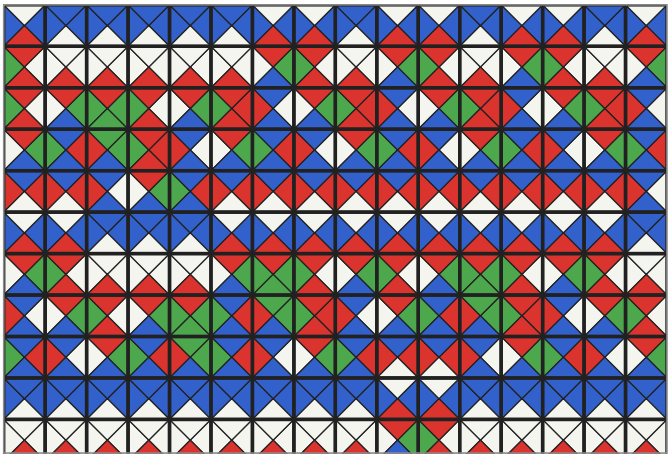

**The same pattern, zellij palette**

Colouring: by shape · zellij palette

# Wang tiles

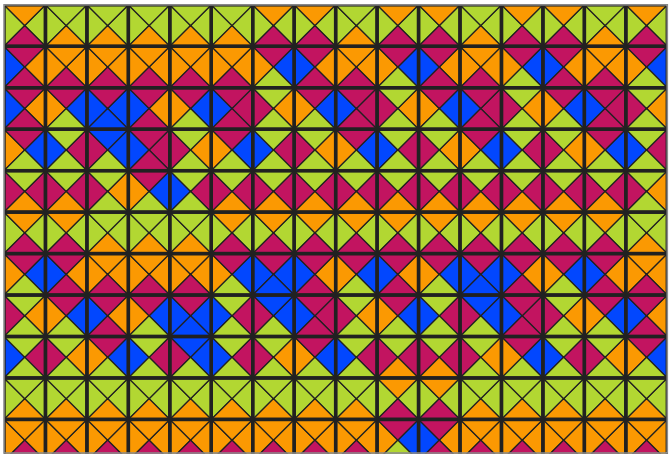

Wikipedia: Wang tile — en.wikipedia.org/wiki/Wang_tile

Squares with coloured edges, placed so that touching edges match and never turned. The 11 tiles of Jeandel and Rao (2015) tile the plane only aperiodically; this patch was found by a backtracking search.

**Jeandel–Rao: 11 tiles, 4 colours, aperiodic**

Colouring: the four edge colours

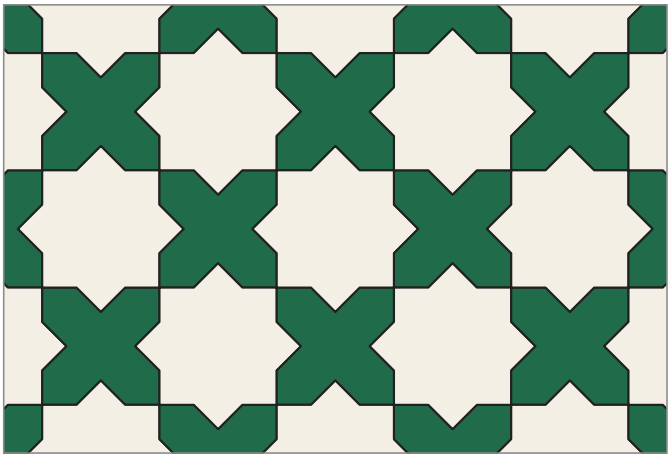

**The same tiles, colours from a scheme**

Colouring: edge colours from a scheme · square (orange)

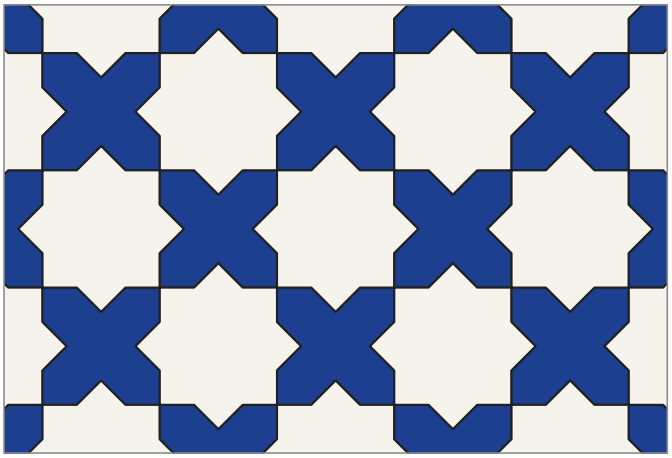

# Zellij

Wikipedia: Zellij — en.wikipedia.org/wiki/Zellij

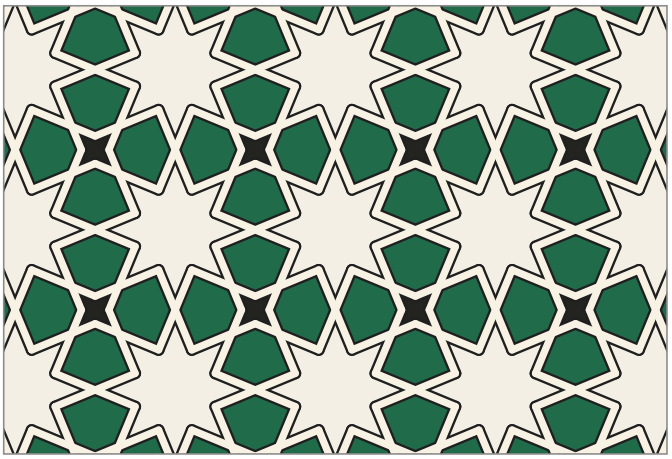

Moroccan and Andalusian mosaic of glazed pieces cut by hand, in white, green, black, ochre and blues. Eight-pointed stars with crosses, and 6-, 8-, 10- and 12-pointed star systems are typical.

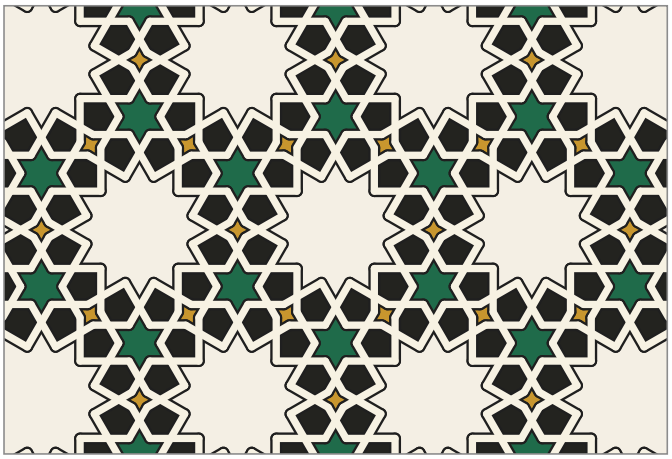

**Eight-pointed stars and crosses**
Colouring: by kind of tile · zellij palette

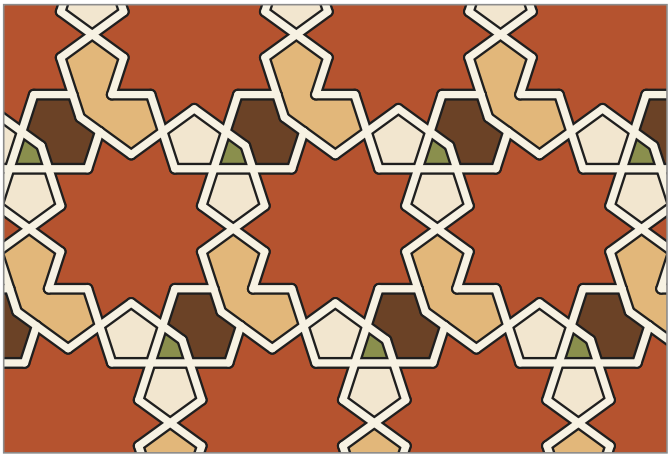

**Stars and crosses in azulejo blues**
Colouring: by kind of tile · azulejo palette

**Eight-pointed stars from octagons in contact**
Colouring: by shape · zellij palette

**Twelve-, six- and four-pointed stars**
Colouring: by shape · zellij palette

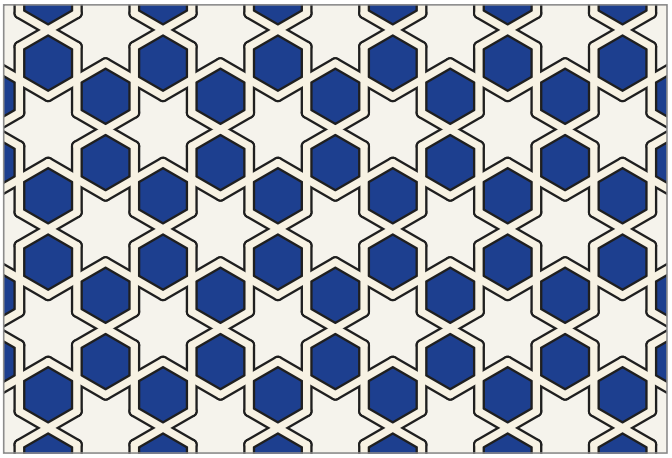

**Ten-pointed stars (girih base)**
Colouring: by shape · earth tones

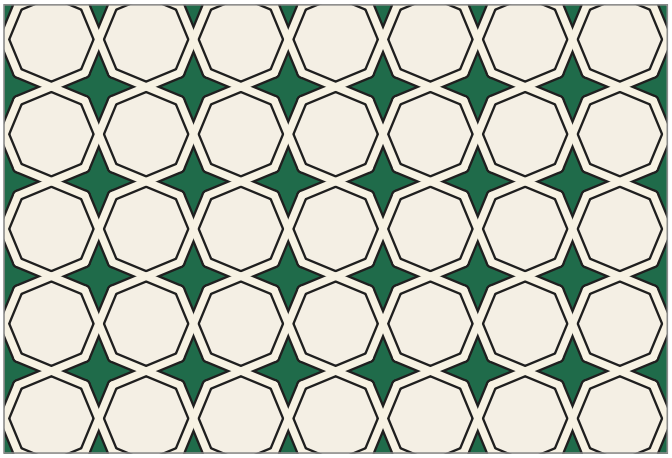

# Islamic geometric patterns

Wikipedia: Islamic geometric patterns — en.wikipedia.org/wiki/Islamic_geometric_patterns

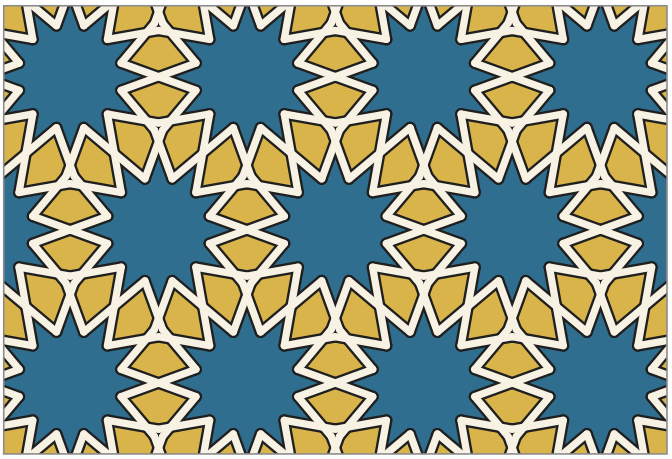

Star patterns made with Hankin's method of polygons in contact: from the middle of each edge of a tiling two lines leave at a fixed angle until they meet. The base tiling and the angle decide the stars; the straps are drawn as ribbons.

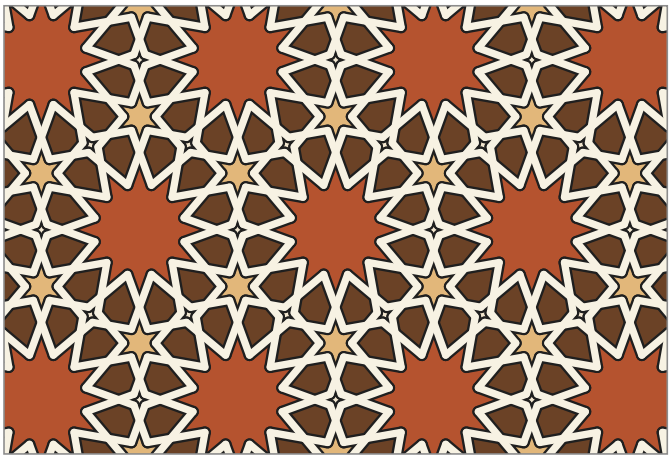

**Six-pointed stars from hexagons in contact**
Colouring: by shape · azulejo palette

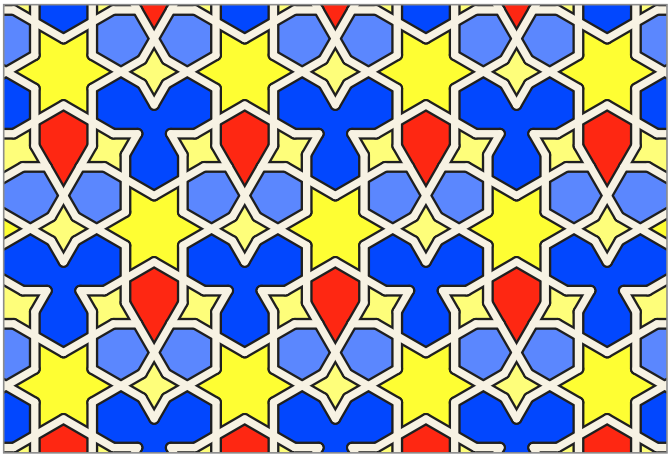

**Octagons and four-pointed stars from squares**
Colouring: by shape · zellij palette

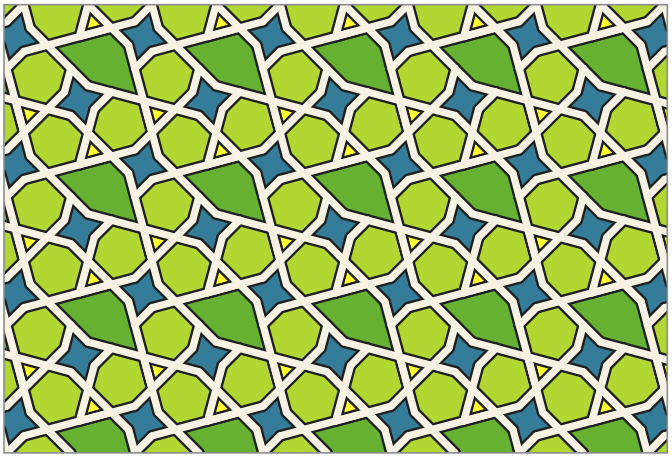

**Twelve-pointed stars from 3.12.12**
Colouring: by shape · girih palette

**Rosettes from 4.6.12**
Colouring: by shape · earth tones

**Stars from 3.4.6.4**
Colouring: by shape · triad (blue)

**Stars from the snub square tiling**
Colouring: by shape · analogous (green)
